Thank you for choosing our product! This User Manual is designed to show you how to use this video processor quickly and make use of all the features. Please read all directions and instructions carefully before using this product.

Declarations

FCC/Warranty

Federal Communications Commission (FCC) Statement

This equipment has been tested and found to comply with the limits for a class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area may cause harmful interference, in which case the user will be responsible for correcting any interference.

Guarantee and Compensation

RGBlink provides a guarantee relating to perfect manufacturing as part of the legally stipulated terms of guarantee. On receipt, the purchaser must immediately inspect all delivered goods for damage incurred during transport, as well as for material and manufacturing faults. RGBlink must be informed immediately in writing of any complains.

The period of guarantee begins on the date of transfer of risks, in the case of special systems and software on the date of commissioning, at latest 30 days after the transfer of risks. In the event of justified notice of compliant, RGBlink can repair the fault or provide a replacement at its own discretion within an appropriate period. If this measure proves to be impossible or unsuccessful, the purchaser can demand a reduction in the purchase price or cancellation of the contract. All other claims, in particular those relating to compensation for direct or indirect damage, and also damage attributed to the operation of software as well as to other service provided by RGBlink, being a component of the system or independent service, will be deemed invalid provided the damage is not proven to be attributed to the absence of properties guaranteed in writing or due to the intent or gross negligence or part of RGBlink.

If the purchaser or a third party carries out modifications or repairs on goods delivered by RGBlink, or if the goods are handled incorrectly, in particular if the systems are commissioned operated incorrectly or if, after the transfer of risks, the goods are subject to influences not agreed upon in the contract, all guarantee claims of the purchaser will be rendered invalid. Not included in the guarantee coverage are system failures which are attributed to programs or special electronic circuitry provided by the purchaser, e.g. interfaces. Normal wear as well as normal maintenance are not subject to the guarantee provided by RGBlink either.

The environmental conditions as well as the servicing and maintenance regulations specified in this manual must be complied with by the customer.
Operators Safety Summary

The general safety information in this summary is for operating personnel.

Do Not Remove Covers or Panels

There are no user-serviceable parts within the unit. Removal of the top cover will expose dangerous voltages. To avoid personal injury, do not remove the top cover. Do not operate the unit without the cover installed.

Power Source

This product is intended to operate from a power source that will not apply more than 230 volts rms between the supply conductors or between both supply conductor and ground. A protective ground connection by way of grounding conductor in the power cord is essential for safe operation.

Grounding the Product

This product is grounded through the grounding conductor of the power cord. To avoid electrical shock, plug the power cord into a properly wired receptacle before connecting to the product input or output terminals. A protective-ground connection by way of the grounding conductor in the power cord is essential for safe operation.

Use the Proper Power Cord

Use only the power cord and connector specified for your product. Use only a power cord that is in good condition. Refer cord and connector changes to qualified service personnel.

Use the Proper Fuse

To avoid fire hazard, use only the fuse having identical type, voltage rating, and current rating characteristics. Refer fuse replacement to qualified service personnel.

Do Not Operate in Explosive Atmospheres

To avoid explosion, do not operate this product in an explosive atmosphere.

Installation Safety Summary

Safety Precautions

For all FLEX 16 installation procedures, please observe the following important safety and handling rules to avoid damage to yourself and the equipment. To protect users from electric shock, ensure that the chassis connects to earth via the ground wire provided in the AC power cord. The AC Socket-outlet should be installed near the equipment and be easily accessible.
Unpacking and Inspection

Before opening FLEX 16 shipping box, inspect it for damage. If you find any damage, notify the shipping carrier immediately for all claims adjustments. As you open the box, compare its contents against the packing slip. If you find any shortages, contact your sales representative. Once you have removed all the components from their packaging and checked that all the listed components are present, visually inspect the system to ensure there was no damage during shipping. If there is damage, notify the shipping carrier immediately for all claims adjustments.

Site Preparation

The environment in which you install your FLEX 16 should be clean, properly lit, free from static, and have adequate power, ventilation, and space for all components.
Chapter 1 Your Product

1.1 In the Box

- **AC Power Cord**
- **CAT5 Cable**
- **Screw Driver**
- **Antistatic Bag**
- **Converter DVI-VGA**
- **Converter DVI-RCA**
- **U Disk**

**Note:**
AC Power Cable supplied as standard according to destination market. USB is contained on the Warranty/Registration Card. Please keep.
1.2 Product Overview

FLEX 16 is a matrix capable to distribute any input signal to any output signal through its consistent modular capability to control up to 16 different inputs and 16 different outputs independently. Different devices can be connected in each output and input. It supports HDMI, DVI, SDI, USB and HDBaseT input and output signals, as well as DP output. FLEX 16 features in splitting mode for up to 32K1K, and simple managed by XPOSE software.

System Connection

RGBlink video processing solutions provide a range of flexible configuration options for professional applications.

1.2.4 Dimension

Following is the dimension of FLEX 16 for your reference:
Chapter 2 Install Your Product

2.1 Plug in Signals
Connect signals to the product (ensure all devices are powered off first). Tighten connector screws/locks where provided. Connect to XPOSE software by CAT5 cable. RGBlink provides a network cable for this connection, as a standard accessories. Please check in the package for this cable.

2.2 Plug in Main Power
Connect IEC cable to device and plug into wall socket. Turn on power at wall socket. The power indicator on front panel lights.
Chapter 3 Use Your Product

3.1 Matrix Panel Operation

3.1.1 MENU Operation

Menu Structure

<table>
<thead>
<tr>
<th>STATUS</th>
<th>RESET</th>
<th>LOGO</th>
<th>LANGUAGE</th>
<th>LOCK</th>
<th>WORK TIME</th>
<th>EDID</th>
</tr>
</thead>
</table>

Basic Operation

Press MENU button and enter the MENU item

→STATUS
RESET

USE the buttons with arrows of up left right down direction to select.

Press ENTER to enter the selected menu item.

STATUS

Shows: the status of each input to output and the LCD screen shows the exact info, as following example In→Out.

1→1  2→2
3→3  4→4

And the software version, serial number and IP address of the device.
RESET
To go back to the beginning status, in the RESET item, LCD screens shows instruction as follow:

PRESS ANY KEY
PRESS MENU TO EXIT

LOGO
Display logo ON/OFF

LANGUAGE
To switch language between Chinese and English

LOCK
Lock front panel and make all buttons invalid. After panel is locked, MENU button flashes. The LCD shows info as follow:

FRONT PANEL LOCKED
PRESS MENU 3S UNLOCK

After front panel is unlocked, MENU button light goes out.

WORK TIME
Show the total boot times and working time up to now.

BOOT TIMES: 15
TOTAL TIME: 650MIN
3.1.2 Button Operation

Power Up
After the device is connect to power, it will automatically boot up. After the device is powered up LCD shows the following:

Select output

Press any button among 1-16 in OUT area, the corresponding output can be selected and the button light illuminates.

Select input

After the output is selected, press the button among 1-16 in IN area and the button flashes. The corresponding input is taken to the output immediately.

Select ALL output

Press button ALL and all buttons in OUT area light up, then press any button in IN area, all outputs display the one selected input. For example, after pressing button ALL and press button 6 in IN area, all the displays shows the image of input 6. The LCD on device shows the info below:

Press button ALL again, all lights go out except button 1 in OUT.
SAVE

If the IN→OUT (matrix) setting need to be saved, press button SAVE, LCD will show instruction as below:

At this time, press any button among 1-16 in IN area, it means save to the corresponding position of 1-16, press any button among 1-16 in OUT area, it means save to the corresponding position of 17-32. i.e., press button 2 in IN area means save to SAVE 2, press button 2 in OUT area, means save to SAVE18.

LOAD

If the saved setting need to be recalled, press button LOAD, LCD will show as below:

The buttons keep illuminating indicates that these SAVE are available and the latest saved position flashes. i.e there are in 2 position SAVE 2 and SAVE 18 in sequence, Button 2 in IN area keep illuminating and button 2 in OUT area flashes.

POWER-STAND BY MODE

Press button POWER LCD shows the indication as follow:

In stand by mode, press POWER for 3S, all buttons flashes one by one immediately and LCD shows:

5S later, the device goes back to work and in the status before stand by.

1. Double click icon, it will pop-up the Installer Language box, select the language, for example, select “English”, and click “OK” to confirm.

![Installer Language](image1.png)

It will pop-up the installer box, and click “Next” to install, as follows:

![Installer Box](image2.png)

2. Select “Browse...” to select the XPOSE software install location and click install:

![Choose Install Location](image3.png)
3. User should get the rights in “Roles Management” when install the software to disk C if the system is Windows 7 or above.

4. Click “Finish” and is ready to run the XPOSE management software:
3.2.3 Login to the Software

1. Double click the icon on the desktop, then login into the interface. The user name is Admin, and defaultly there is no password. Select “FLEX 16”, select language “English” and enter the software by clicking “Login”.

![Login Interface](image1)

2. If user wants to change the language to Chinese, click the drop down arrow after “Language” and select “中文”, then click “Login” to enter the software.

![Login Interface (Chinese)](image2)

3. After entering the software, the main interface shows as follows:
XPOSE management software consists of Output Setting, Operation Mode, System Settings and Log out. In the following parts come with the detail.

### 3.2.4 Connect to Software

The remote controller PC which runs XPOSE connects with Flex 16 by the network cable or USB-RJ11 serial cable (with the standard accessories).

After login on XPOSE, Search device and find FLEX 16
Click the FLEX 16 icon and sync

And sync done.
3.2.5 Output Setting

Output setting
28 types of standard resolution available to choose.

User can custom the resolution if no proper resolution in the list,

Note: Avoid using following resolution
720x480i@60Hz and 720x576i@50Hz (not supported on all output modules),
2560*816@60 and 2048*1152@60 (not supported on DVI and HDMI output) .
Output setting is for all output ports from one output EXT (EXT-4 or EXT-6)

DE setting
Board type: EXT-6 (EXT 4F-OS Splicing EXT interface) EXT 4 (EXT 4F OM Matrix EXT interface, EXT 4F IM matrix input ext interface)
Port: 1-16
Output Type: DVI or HDMI
Color Range: Image or Video
Bits: DVI 8bits, HDMI 8bits | 10bit | 12bit
Brightness: 0-128
Out/In: Output Setting or Input Setting, when choose EXT 4, users need to choose output setting or input setting.

DE setting done
3.2.6 Operation Mode

There are 2 working modes, including the Matrix mode and Splitting Mode. Click the “Operation Mode”, and enter the interface as follows:

Matrix Mode and Splitting Mode are included in operation mode, specific as follows:

**Matrix Mode**
Click the “Matrix Mode”, and enter to the interface as follows:
1. Choose input source from the signal source list
2. Drag the signal source to Signal
3. Click Take
4. The display will show the input source correspondingly as the following show:
1 In→All Out
1. Choose one input source from the signal source list
2. Click All
3. Click Take
4. All display will show the one chosen input source as the following show:

For FLEX 16 with matrix front panel, users can use XPOSE or front panel panel to control the device but cannot enter splitting mode.

For FLEX 16 with basic front panel, users use XPOSE to control and can use splitting mode.
Splitting Mode

Click the “Splitting Mode”, and pop-up window as follow:

To do quick splitting, users can choose signal from signal list and drag it to the window. Drag the border of the layer to cover all the monitors.

For example, do splitting on 4 monitors, after setting the resolution of each output, drag the input source to the output window and cover up all outputs.
To make the signal cover up all outputs more exactly, users can type in the total width and height of the desired video wall size.

Input Setting
The signal list is shown as follows:
It displays the input module type, the quantity of inputs and input format. Click “…” after the format of input for the following settings:

**For HDMI and SDI input there are settings as below:**

**Change Name:** Select “New Name”, and input the new name, click “OK” after setting.

**Set Input Property:** Right click the input and select “Input Property”, it will enter to the interface as follows:
Scale: Set the X, Y, width and height.
Crop: Crop the left, top, width and height.
**Display Mode**: Select “Live” or “Freeze”.
**Mirror**: Enable or disable the mirror function, default “OFF”.
**Bypass Mode**: Enable or disable the bypass mode. When select “ON”, the output format will be the same with the input format.
**Alpha**: Set the alpha, the adjustment range is 0~128.
**Sharpness**: Set the sharpness, the adjustment range is 0~100.
**Brightness**: Set the brightness, the adjustment range is 0~100.
**Contrast**: Set the contrast, the adjustment range is 0~100.
**Saturation**: Set the saturation, the adjustment range is 0~100.
**Color Term**: Set the color temp (red, green and blue), the adjustment range is 0~100.
**Reset**: Select “Reset”, the input property will be recover to factory setting.

**Test Pattern**: Slide the Test Pattern switch to enable or disable the function.

For USB input setting there is USB player setting
select “USB Player”, it will enter to the USB Player interface, including movie and picture, default play the USB picture.

USB movie player setting: Can select play in order, random, single cycle and all cycle, switch to pre or next, pause or play, and read the movie name, progress bar and time.
USB picture play time: Click the picture, it will display the setting interface, default the time is 0s. Set the switch time, and click “Set”.

USB picture player setting: Can select play in order, random, single cycle and all cycle, and switch to pre or next, pause or play.

DVI module of FLEX series is compatible with VGA, CVBS, YPbPr signals via adapter, therefore for other signal such as VGA input, users need to choose VGA in DVI input setting as below:
Output Setting

Click on shortcut , it will enter the interface as follows:

Close monitor: Click the icon on the top right corner of the monitor to close one monitor, or click the shortcut on the right side of the interface to close all monitors.

Reset outputs: User can reset outputs by clicking the shortcut on the right side of the interface.

Swap outputs: User can swap outputs by clicking the shortcut on the right side of the interface.
interface, as shown in the figure below.

![Swap Outputs](image)

**Auto tile:** User can enable or disable the auto tile function by clicking the auto tile shortcut on the right side of the interface. If select auto tile “ON”, the layer will automatically snap to the output grid when move the layer to the position within the threshold value.

**Monitor Size and Position Setting:** Move the mouse to the lower right brink of the monitor, and press the left key of the mouse. Move the mouse to the suitable position and release the mouse. But this method can only adjust the size and location roughly, if an accurate adjustment is needed, select the monitor, and set the X, Y, width and height in the bottom of the interface.

![Monitor Size](image)

**Monitor Size changed equivalently:** Select any monitor, for example, select monitor 1, and adjust the size. Click this monitor, then press button C and don’t let go, select the monitor that will set, the size of the selected monitor will be changed to the same size of monitor 1, as shown in the figure below:
**Rotation:** Select the monitor, and set the rotation as 0°, 90°, 180° and 270° in the bottom of the interface. Click “OK” to confirm. As shown in the figure below:

![Rotation Interface]

Note: select any 1 out of the 4 outputs which are connected to the same EXT extension interface.

Right click the monitor can also rotate the monitor.

**Output Area Size Setting:** Move the mouse to the output area and slide the mouse wheel, the output area size can be zoom in and out

**Adjust Layer:** Two ways can change the size and location of the opened layer:

a. Drag the opened layer by mouse. The details are: move the mouse to the brink of the opened layer, when the mouse shows”<—>”, press the left key of the mouse and drag the window to a suitable size and then release the mouse. Or move the mouse to the lower right of the opened layer, press the left key of the mouse and drag the window to a suitable size and then release the mouse. Move the mouse to the opened layer and press the left key of the mouse and move the mouse, then the layer will be moved, release the mouse when moved to the suitable location. But this method can only adjust the size and location roughly, if an accurate adjustment is needed, the second method can be used.

b. Select the layer to be adjusted, and set the X, Y, width and height in the bottom of the interface.
Hierarchical relations between layers: After creating the layers, the hierarchical relations can be changed by the following: click the shortcut key bring layer to front " ", send layer to bottom " ", layer forward " ", or layer backward " ". The layer can be set as background by click " ". and click " ", to close layer background.

Close one layer or all layers: Click the icon on the top right corner of the layer to close one layer, or click the shortcut key " ", to close all layers.

Lock the layer: Click the icon on the top right corner of the layer to lock the layer, the layer can’t be moved or adjusted if be locked.

Full the layer: Click the icon on the top right corner of the layer to full cell, and click the icon to full screen.

Copy and paste bank: Select the bank that to copy, and click the copy bank shortcut " ", on the right side of the interface, then select the bank that to paste, and click the paste bank shortcut " ". The selected layer will pasted to the bank.

Adaptive: If scale the output area to a large area, click the adaptive shortcut " ", on the right side of the interface, the output area will be return to the best position.

Layer Property Setting

Select the layer to be adjusted, click the More shortcut " ", in the bottom of the interface, and enter the interface as follows:
Scale: Set the X, Y, width and height.
Crop: Crop the left, top, width and height.
Display Mode: Select “Live” or “Freeze”.
Mirror: Enable or disable the mirror function, default “OFF”.
Bypass Mode: Enable or disable the bypass mode. When select “ON”, the output format will be the same with the input format.
Alpha: Set the alpha, the adjustment range is 0~128.
Sharpness: Set the sharpness, the adjustment range is 0~100.
Brightness: Set the brightness, the adjustment range is 0~100.
Contrast: Set the contrast, the adjustment range is 0~100.
Saturation: Set the saturation, the adjustment range is 0~100.
Color Term: Set the color temp (red, green and blue), the adjustment range is 0~100.
Reset: Select “Reset”, the input property will be recover to factory setting.

**Take**
The take interface is shown as the figure below:

Set the transition time, and the adjustment range is 0~10S.
Slide the black out switch to enable or disable the black function. Auto take on is the default state. If select black out and auto take on, the preview image will black or seamless switch to LED display instantaneously.
Click “Cut” or “Take”, the preview will be cut or seamless switch to LED display.

**EDID**
Click the EDID shortcut “”, and pop-up window as follows:
The special display project or LED display application would like to require special resolution settings to meet the requirement. Select the input or output board to read and write the EDID. As shown in the figure below:

Loop

Click the loop shortcut "Loop", and pop-up window as follows:

Timing Loop
Slide the loop switch to enable or disable the timing loop function for the bank. If select “ON”, the exact time to play the bank can be set.

**Times Loop**
Slide the loop switch to enable or disable the times loop function for the bank. If select “ON”, the exact length of time to play the bank can be set.

![Loop Setting](image)

**Sync**
Click the sync shortcut “Sync” to synchronize the current data.

**Load Script**
Click the load script shortcut “Load Script”, user can load the data from the computer.

**Save Script**
Click the save script shortcut “Save Script”, user can save the data to the computer.

**Factory Reset**
Click the factory reset shortcut “Factory Reset” to reset to factory settings.
Page Set

Click the page set shortcut "Page Set" to load and save pages.

Shortcut Keys

Click the shortcut "Shortcut Keys", and pop-up window as follows:

Use shortcut key to operate fast and easily.
3.2.7 System Settings

Click “System Settings” in the main interface:

**Connect Setting**

Click “Connect Setting”: Select “COM Port” and “Baud Rate”, click the drop down arrow after them, and click “OK”.

![Serial Connect Configuration](image)

Setting the device connecting ways: Serial Connect, Ethernet Connect and Search by this configuration.

After setting “COM Port” and “Baud Rate”, pop-up window as follows:
IP Settings

Click the “IP Settings”, and pop-up window as follows:

![IP Settings]

Default “Auto get IP address”. Users can also set IP address, Mask and GateWay manually. This is usually used if one computer control some devices or remote control. It takes effect after reboot the software if change IP through network.

System Information

Click “System Information”, and pop-up window as follows:

![System Information]

Display the device version information. Including Model Number, Serial Number, IP Address, firmware version, etc.
Factory Reset

Click “Factory Reset”, and pop-up window as follows:

Click “OK” or “Cancel” to confirm the reset.

Power On Setting Fan Control
To enable Delay Power On Setting, slide OFF to ON, set Time-Lapse Power On in 0~2555.
To disable Auto Fan control setting, slide OFF to ON, Set Fan Speed at 0~100
3.2.8 Logout

Click “Logout” button to exit the XPOSE software, and pop up window as follows:

![Logout pop up window]

Click “cancel” or “OK” to confirm

![Confirm to close the software window]

User also can be click the right corner red button to exit software directly.

**Connectors**: BNC

**Supported Standard**: SMPTE 425M (Level A & B) | SMPTE 424M | SMPTE 292M | SMPTE 259M-C | DVB-ASI

**Supported Resolution**: SMPTE 720p@50/59.94/60 | 1080i@50/59.94/60 | 1080p@23.98/24/25/29.97/30/50/59.94/60

### Extras

| Communication | 1×LAN | 1×RS232 (1×RJ45 | 1×RJ11) |
|---------------|-------|-----------------|

**Power Supply**: AC 90-264V, 50/60Hz

**Max Power**: 205W

**Working Environment**: 0°C-40°C

**Relativity Humidity**: 10% – 85% RH

**Weight**: 8.05 kg

**Dimensions**: 484mm×467mm×89mm

**Product Warranty**: 3 years parts and labor warranty
6.2 Terms & Definitions

The following terms and definitions are used throughout this guide.

- **“ASCII”**: American Standard for Information Interchange. The standard code consisting of 7-bit coded characters (8 bits including parity check) used to exchange information between data processing systems, data communication systems, and associated equipment. The ASCII set contains control characters and graphic characters.

- **“Aspect ratio”**: The relationship of the horizontal dimension to the vertical dimension of an image. In viewing screens, standard TV is 4:3; or 1.33:1; HDTV is 16:9, or 1.78:1. Sometimes the “:1” is implicit, making TV = 1.33 and HDTV = 1.78.

- **“AV”**: Audio visual, or audio video.

- A “Background” is an unscaled source, typically originating from a computer. A background source appears at the system’s lowest priority — visually in back of all other sources.

- **“Baudrate”**: Named of J.M.E. Baudot, the inventor of the Baudot telegraph code. The number of the electrical oscillations per second, called baud rate. Related to, but not the same as, transfer rate in bits per second (bps).

- **“Blackburst”**: The video waveform without the video elements. It includes the vertical sync, horizontal sync, and the chroma burst information. Blackburst is used to synchronize video equipment to align the video output. One signal is normally used to set up an entire video system or facility. Sometimes it is called House sync.

- **“BNC”**: Bayonet Neill-Concelman. A cable connector used extensively in television and named for its inventors. A cylindrical bayonet connector that operates with a twist-locking motion. To make the connection, align the two curved grooves in the collar of the male connector with the two projections on the outside of the female collar, push, and twist. This allows the connector to lock into place without tools.

- **“Brightness”**: Usually refers to the amount or intensity of video light produced on a screen without regard to color. Sometimes called “black level.”

- **“CAT 5”**: Category 5. Describes the network cabling standard that consists of four unshielded twisted pairs of copper wire terminated by RJ-45 connectors. CAT 5 cabling supports data rates up to 100 Mbps. CAT 5 is based on the EIA/TIA 568 Commercial Building Telecommunications Wiring Standard.

- **“Color bars”**: A standard test pattern of several basic colors (white, yellow, cyan, green, magenta, red, blue, and black) as a reference for system alignment and testing. In NTSC video, the most commonly used color bars are the SMPTE standard color bars. In PAL video, the most commonly used color bars are eight full field bars. In the computer, the most commonly used color bars are two rows of reversed color bars.

- **“Color burst”**: In color TV systems, a burst of subcarrier frequency located on the back porch of the composite video signal. This serves as a color synchronizing signal to establish a frequency and phase reference for the chroma signal. Color burst is 3.58 MHz for NTSC and 4.43 MHz for PAL.
• **“Color temperature”**: The color quality, expressed in degrees Kelvin (K), of a light source. The higher the color temperature, the bluer the light. The lower the temperature, the redder the light. Benchmark color temperature for the A/V industry include 5000°K, 6500°K, and 9000°K.

• **“Contrast ratio”**: The ratio of the high light output level divided by the low light output level. In theory, the contrast ratio of the television system should be at least 100:1, if not 300:1. In reality, there are several limitations. In the CRT, light from adjacent elements contaminate the area of each element. Room ambient light will contaminate the light emitted from the CRT. Well-controlled viewing conditions should yield a practical contrast ratio of 30:1 to 50:1.

• **“DVI”**: Digital Visual Interface. The digital video connectivity standard that was developed by DDWG (Digital Display Work Group). This connection standard offers two different connectors: one with 24 pins that handles digital video signals only, and one with 29 pins that handles both digital and analog video.

• **“EDID”**: Extended Display Identification Data – EDID is a data structure used to communicate video display information, including native resolution and vertical interval refresh rate requirements, to a source device. The source device will then output the optimal video format for the display based on the provided EDID data, ensuring proper video image quality. This communication takes place over the DDC – Display Data Channel.

• **“Ethernet”**: A Local Area Network (LAN) standard officially known as IEEE 802.3. Ethernet and other LAN technologies are used for interconnecting computers, printers, workstations, terminals, servers, etc. within the same building or campus. Ethernet operates over twisted pair and over coaxial cable at speeds starting at 10Mbps. For LAN interconnection, Ethernet is physical link and data link protocol reflecting the two lowest layers of the OSI Reference Model.

• **“Frame”**: In interlaced video, a frame is one complete picture. A video frame is made up of two fields, or two sets of interlaced lines. In a film, a frame is one still picture of a series that makes up a motion picture.

• **“Gamma”**: The light output of a CRT is not linear with respect to the voltage input. The difference between what you should have and what is actually output is known as gamma.

• **“HDMI” - High – Definition Multimedia Interface**: An interface used primarily in consumer electronics for the transmission of uncompressed high definition video, up to 8 channels of audio, and control signals, over a single cable. HDMI is the de facto standard for HDTV displays, Blu-ray Disc players, and other HDTV electronics. Introduced in 2003, the HDMI specification has gone through several revisions.

• **“HDSDI”**: The high-definition version of SDI specified in SMPTE-292M. This signal standard transmits audio and video with 10 bit depth and 4:2:2 color quantization over a single coaxial cable with a data rate of 1.485 Gbit/second. Multiple video resolutions exists including progressive 1280x720 and interlaced 1920x1080 resolution. Up to 32 audio signals are carried in the ancillary data.

• **“JPEG” (Joint photographic Expects Group)**: Commonly used method of lossy compression for photographic images using a discreet cosine transfer function. The
degree of compression can be adjusted, allowing a selectable tradeoff between
storage size and image quality. JPEG typically achieves 10:1 compression with little
perceptible loss in image quality. Produces blocking artifacts.

- **“MPEG”:** Motion Picture Expect Group. A standard committee under the auspices
  of the International Standards Organization working on algorithm standards that allow
digital compression, storage and transmission of moving image information such as
motion video, CD-quality audio, and control data at CD-ROM bandwidth. The MPEG
algorithm provides inter-frame compression of video images and can have an
effective compression rate of 100:1 to 200:1.

- **“NTSC”:** The color video standard used in North America and some other parts
  of the world created by the National Television Standards Committee in the 1950s. A
color signal must be compatible with black-and-white TV sets. NTSC utilizes an
interlaced video signals, 525 lines of resolution with a refresh rate of 60 fields per
second (60 Hz). Each frame is comprised of two fields of 262.5 lines each, running
at an effective rate of 30 frames per second.

- **“Operator”:** Refers to the person who uses the system.

- **“PAL”:** Phase Alternate Line. A television standard in which the phase of the color
  carrier is alternated from line to line. It takes four full pictures (8 fields) for the
  color-to-horizontal phase relationship to return to the reference point. This
  alternation helps cancel out phase errors. For this reason, the hue control is not
  needed on a PAL TV set. PAL, in many transmission forms, is widely used in
  Western Europe, Australia, Africa, the Middle East, and Micronesia. PAL uses
  625-line, 50-filed (25 fps) composite color transmission system.

- **“PIP”:** Picture-in-Picture. A small picture within a larger picture created by scaling
down one of the images to make it smaller. Each picture requires a separate video
source such as a camera, VCR, or computer. Other forms of PIP displays include
Picture-by-Picture (PBP) and Picture-with-Picture (PWP), which are commonly used
with 16:9 aspect display devices. PBP and PWP image formats require a separate
scaler for each video window.

- **“Polarity”:** The positive and negative orientation of a signal. Polarity usually refers to
  the direction or a level with respect to a reference (e.g. positive sync polarity means
  that sync occurs when the signal is going in the positive direction).

- **“RJ-45”:** Registered Jack-45. A connector similar to a telephone connector that
  holds up to eight wires, used for connecting Ethernet devices.

- **“RS-232”:** An Electronic Industries Association (EIA) serial digital interface standard
  specifying the characteristics of the communication path between two devices using
  either DB-9 or DB-25 connectors. This standard is used for relatively short-range
  communication and does not specify balanced control lines. RS-232 is a serial
  control standard with a set number of conductors, data rate, word length, and type of
  connector to be used. The standard specifies component connection standards with
  regard to the computer interface. It is also called RS-232-C, which is the third
  version of the RS-232 standard, and is functionally identical to the CCITT V.24
  standard.

- **“Saturation”:** Chroma, chroma gain. The intensity of the color, or the extent to which
a given color in any image is free from white. The less white in a color, the truer the
color or the greater its saturation. On a display device, the color control adjusts the
saturation. Not to be confused with the brightness, saturation is the amount of
pigment in a color, and not the intensity. Low saturation is like adding white to the
color. For example, a low-saturated red looks pink.

- **"Scaling"**: A conversion of a video or computer graphic signal from a starting
resolution to a new resolution. Scaling from one resolution to another is typically
done to optimize the signal for input to an image processor, transmission path or to
improve its quality when presented on a particular display.

- **"SDI"**: Serial Digital Interface. The standard based on a 270 Mbps transfer rate. This
is a 10-bit, scrambled, polarity independent interface with common scrambling for
both component ITU-R 601 and composite digital video and four channels of
(embedded) digital audio.

- **"Seamless Switching"**: A feature found on many video switchers. This feature
causes the switcher to wait until the vertical interval to switch. This avoid a glitch
(temporary scrambling) which normally is seen when switching between sources.

- **"SMPTE"**: Society of Motion Picture and Television Engineers. A global organization,
based in the United States, that sets standards for baseband visual communications.
This includes film as well as video and television standards.

- **"S-Video"**: A composite video signal separated into the luma ("Y" is for luma, or
black and white information; brightness) and the chroma ("C" is an abbreviation for
chroma, or color information).

- **"Sync"**: Synchronization. In video, sync is a means of controlling the timing of an
event with respect to other events. This is accomplished with timing pulses to insure
that each step in a process occurs at the correct time. For example, horizontal sync
determines exactly when to begin each horizontal scan line. Vertical sync
determines when the image is to be refreshed to start a new field or frame. There
are many other types of sync in video system.(Also known as "sync signal" or "sync
pulse.")

- **"TCP/IP"**: Transmission Control Protocol/Internet Protocol. The communication
protocol of the Internet. Computers and devices with direct access to the Internet are
provided with a copy of the TCP/IP program to allow them to send and receive
information in an understandable form.

- **"USB"**: Universal Serial Bus. USB was developed by seven PC and telecom industry
leaders (Compaq, DEC, IBM, Intel, Microsoft, NEC, and Northern Telecom). The
goal was easy plug-and-play expansion outside the box, requiring no additional
circuit cards. Up to 127 external computer devices may be added through a USB
hub, which may be conveniently located in a keyboard or monitor. USB devices can
be attached or detached without removing computer power. The number of devices
being designed for USB continues to grow, from keyboards, mice, and printers to
scanners, digital cameras, and ZIP drives.

- **"VESA"**: Video Electronics Standards Association. A nonprofit number organization
dedicated to facilitating and promoting personal computer graphics through
improved standards for the benefit of the end-user. www.vesa.org
"VGA": Video Graphics Array. Introduced by IBM in 1987, VGA is an analog signal with TTL level separate horizontal and vertical sync. The video outputs to a 15-pin HD connector and has a horizontal scan frequency of 31.5 kHz and vertical frequency of 70 Hz (Mode 1, 2) and 60 Hz (Mode 3). The signal is non-interlaced in modes 1, 2, and 3 and interlaced when using the 8514/A card (35.5 kHz, 86 Hz) in mode 4. It has a pixel by line resolution of 640×480 with a color palette of 16 bits and 256,000 colors.

"YCrCb": Used to describe the color space for interlaced component video.

"YPbPr": Used to describe the color space for progressive-scan (non-interlaced) component video.
