

TAO1tiny V2 Upgrade Guide

1. USB flash drive upgrade steps

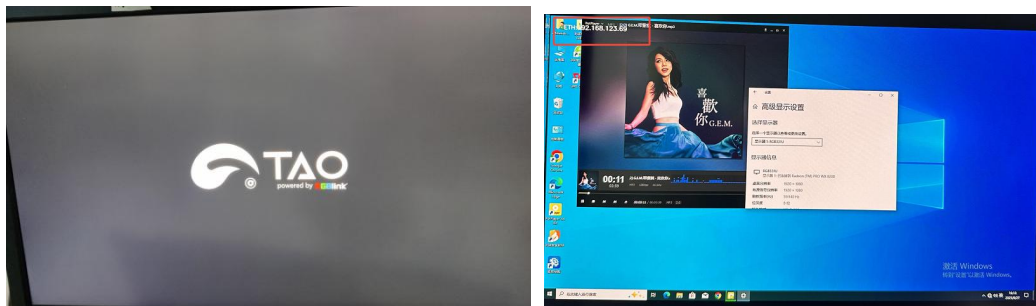

(1) Copy the upgrade file to the root directory of a USB flash drive. Use FAT32 format for the USB flash drive. (It is recommended not to place other files in the USB flash drive. If there are other files, the upgrade time will increase.)

(2) Connect the device to the input and output, power on the device, wait for the signal to stabilize, then insert the USB drive into the USB2.0 interface, and wait for about 30 seconds for the upgrade prompt to appear.

(3) It takes about 1 and a half minutes to upgrade the system. Try not to touch the power cord during this process to avoid interrupting the upgrade and causing the upgrade to fail. After the progress bar shown in the above picture is completed, the output will be black. Unplug the USB drive. The current device has been upgraded and the device will automatically restart and display the boot logo. After normal startup, the device IP address will be displayed in the upper left corner of the output.

(4) Connect to the internet, enter the IP address on the webpage, and check if the device version

number matches the upgrade version. Enter the username and password on the webpage. On the Advanced Settings page, you can see the version number on the right side, as shown in the image below:V1.36
